

Pain Points and Plans Table

Interface	Pain Point	Plan
Customer Kiosk	Translation delays cause flickering and slow UI when switching languages	Implement translation caching and preload common translations; show loading indicators during translation
Customer Kiosk	Menu loading failures show technical error messages that confuse users	Provide user-friendly error messages with retry options and fallback to cached menu data if available
Customer Kiosk	Complex navigation flow with 7+ views makes it hard to go back or understand current location	Add breadcrumb navigation and a persistent "Back to Home" button; simplify the view hierarchy
Customer Kiosk	Cannot edit cart items if the original menu item becomes unavailable	Allow editing of customizations even if item is unavailable, or show a clear message with alternative suggestions
Customer Kiosk	Cart data is lost on page refresh or navigation away from kiosk	Implement localStorage persistence for cart items with expiration; restore cart on return
Customer Kiosk	No search functionality; users must browse categories to find specific items	Add a search bar on the home and menu views with autocomplete and category filtering

Customer Kiosk	Active order status polling every 12 seconds is inefficient and may drain resources	Use WebSocket connections or Server-Sent Events for real-time updates instead of polling
Customer Kiosk	Promo code validation is only client-side; invalid codes may be accepted	Add server-side validation with clear error messages and a list of valid promo codes
Customer Kiosk	Nutrition information may fail to load with unclear error messages	Show a clear fallback message when nutrition data is unavailable; add retry functionality
Customer Kiosk	Quantity adjustment requires multiple clicks; no direct number input	Add a number input field alongside increment/decrement buttons for faster quantity changes
Customer Kiosk	No favorites or recent items; users must navigate categories each time	Add a "Recent Orders" quick-access section on the home screen for logged-in users
Customer Kiosk	Order confirmation dialog appears when navigating away during customization, which can interrupt flow	Improve the dialog timing and make it less intrusive; auto-save customization state
Customer Kiosk	Past orders loading shows generic error messages that don't help users understand the issue	Provide specific, actionable error messages (e.g., "Unable to connect to server" vs "Invalid user ID")

Customer Kiosk	No visual feedback during order submission; users may click multiple times	Add loading states and disable the submit button during order processing; show progress indicators
Customer Kiosk	Weather tile may fail to load and block the home screen layout	Make weather tile optional/non-blocking; show a placeholder if weather data fails to load
Customer Kiosk	Accessibility toolbar is fixed at bottom-right and may obscure content on smaller screens	Make the toolbar collapsible or repositionable; ensure it doesn't block critical UI elements
Customer Kiosk	No way to see estimated wait time or order preparation status from the kiosk after ordering	Display estimated preparation time on the receipt screen and allow users to check order status
Customer Kiosk	Item customization options (toppings, sizes) are not translated until after selection	Pre-translate all customization options when the menu loads to reduce translation delays
Customer Kiosk	No way to save incomplete orders for later completion	Add a "Save for Later" feature that stores cart items in user profile for future sessions
Customer Kiosk	Checkout process doesn't show item details clearly; users may not remember what they ordered	Enhance checkout screen to show full item details with customization options in an expandable format
